

## Client - Patch Program - EDM for Sage X3

### What is it used for?

The Patch Program is a UI that allows existing R13 installations to be updated.

An update is in the form of a patch, downloaded from the Portal as a zip file.

The Patch Program will un-compress this zip file, analyse what has been installed and update it with the contents of the zip file's patch content.

**Patches are incremental in nature and as such must be applied in numerical order, i.e. Patch 1 first, then Patch 2, then Patch 3 and so on as they are released.**

**You are not permitted to go install them out of order.**

**NOTE: Prior to running the Patch Program for clients, ensure the Server has been updated first.**

### How do I use it?

1. On the client where R13 has been installed, navigate to the [portal](#)
2. In the menu, click Downloads
3. A list of available patches is displayed
4. Click on each and download it to a convenient area on disk
5. Back on the portal, in the menu, click Downloads
6. Click on the Patch program link and download it, un-compress it to a convenient area on disk
7. Right click on PatchProgram.exe and **run as administrator**
8. The PatchProgram is initialised and you will then be prompted to select Server or Client, select Client
9. Browse to the location of the first zip file patch you wish to apply
10. Click Update, the zip file is un-compressed for you to a temporary location and the updates are applied
